Hiring Manager

Waymo — Software Engineer, Discovery Eval

Dear Hiring Manager,

- At Urban Mapping, I built the first eval metric on serving Tableau map tiles, which became part of our company’s CI/CD, which I also built.
- At HiQ Labs, I built their first analytics dashboard to observe the quality of our scraping pipelines, which helped us identify and fix data quality issues.
- At SimpleLegal, I built their first QC pipeline, redefined their rubric, and launched their stuck AI feature, which improved data quality and reduced manual review time.
- At Sindri, I built a Temporal-based evaluation CLI framework that formalizes evaluation as an engineered workflow: author expectations in YAML, execute workflows, collect run snapshots (DB side-effects + activity outputs), and automatically test expectations with clear failure reporting. I also implemented an iterative “LLM-as-judge” loop to optimize AI email quality.

I’d bring three strengths that fit this role well:

Product-to-engineering translation (as an IC): I’ve repeatedly partnered with SMEs and cross-functional stakeholders to convert qualitative “we need confidence in X” requirements into concrete metrics, data tasks, and tooling—then implemented the end-to-end solution.

Statistical rigor on real-world pipelines: My PhD work focused on creating and validating new metrics, and in industry I’ve been hands-on with sampling, measurement design, and “what does this number actually mean?” analysis—especially when we need to dive deeper into the nuances of the mental model of our customer.

Infrastructure that makes evaluation dependable: Across roles, I’ve built and extended production pipelines (SQL/databases, Python, distributed data systems), plus observability and consistency mechanisms so evaluation outputs stay comparable across runs, teams, and time.

Waymo’s mission and the scale of your evaluation challenges motivate me: building measurement systems that earn trust, hold up under scrutiny, and accelerate safe deployment. I’d love to bring my evaluation engineering background to Behavior Sets and help strengthen the quality, consistency, and statistical foundations of Waymo’s driving evaluation tooling.

Sincerely, Boris Dev
